EDUCATION

California State Polytechnic University, Pomona
Bachelor of Science in Computer Science, Minor in Data Science

Pomona, CA
Dec. 2025

EXPERIENCE

10a Labs

Jun. 2026 – Present

Cyber Triage Analyst

Contract

- Investigate high-signal cyber abuse cases surfaced daily from internal detection systems for frontier AI models, analyzing conversations for jailbreaks, classifier failures, and policy-violating use involving malware, exploitation, and offensive cyber activity.
- Conduct adversarial probing and attack reproduction to validate suspected jailbreaks, characterize evasion techniques, and distinguish genuine model-security failures from false positives or overstated attack claims.
- Identified systematic failure modes in an AI-assisted investigation pipeline by manually probing and re-evaluating high-confidence cases; findings informed system fixes that improved the precision and reliability of surfaced cases.
- Surface classifier and feed failures to alignment and engineering partners and escalate novel jailbreak patterns to safeguards, translating investigations into actionable model-safety findings.
- Deliver weekly enforcement handoffs on policy-violating users and organizations, producing documented assessments that support account- and organization-level enforcement decisions.

CALSys Lab

Jan. 2025 – Jun. 2026

Research Assistant

- Analyzed 200K+ dark-web marketplace records to study adversarial vendor behavior; developed a 21-category hacking taxonomy and applied prototype-initialized SBERT clustering to classify ~25K hacking-related listings across 34 marketplaces.
- Developed a cross-market community-detection pipeline using vendor identity resolution, vendor-product bipartite graphs, BiLouvain/BiLeiden, and controlled marketplace splits to test whether vendor expertise communities reproduce across independent environments.
- Evaluated community robustness using Adjusted Rand Index (ARI) while iterating on identity-matching signals, edge-weighting strategies, balance constraints, and alternative graph formulations; co-authoring a manuscript on adversarial vendor community detection targeted for conference submission in Jan. 2027.

Ingram Micro

Jun. 2025 – Aug. 2025

Data Reliability Engineer Intern

- Served as first responder for data discrepancy and freshness issues across large-scale GCP pipelines, writing SQL validation queries and Python scripts to find signal in noisy data and drive fixes across multiple production fleets.
- Documented pipeline failure patterns and communicated root cause analyses to technical and non-technical stakeholders, translating complex system behavior into actionable insights.

TECHNICAL SKILLS

AI Security & Evaluation: LLM red teaming, adversarial testing, jailbreak analysis, attack reproduction, cyber abuse triage, classifier evaluation, model behavior analysis, eval design

Security Research: adversarial prompting, API-based testing, false-positive analysis, isolated test environments, technical investigation, attack validation

ML & Research: Python, Pandas, NumPy, scikit-learn, SBERT, sentence embeddings, K-Means, graph analysis, bipartite graphs, community detection, BiLouvain, BiLeiden, experimental design, Adjusted Rand Index (ARI)

Programming: Python, SQL, JavaScript, TypeScript, Go, Java

Cloud & Infrastructure: Google Cloud (BigQuery, Pub/Sub, Dataflow), AWS (EC2, S3), Docker, OrbStack, Terraform

Databases: PostgreSQL, BigQuery, MySQL, MongoDB

Spoken: English (Native), Spanish (Native)
